

This book is an authoritative and comprehensive account of the principles and practice of modern NMR spectroscopy of solid polymers to determine their structure and dynamics at a molecular level. The book deals with the development of many new NMR capabilities, including high-resolution techniques for solids, multi-dimensional methods, deuterium NMR and others. All of these developments have contributed to a dramatic increase in the power and applicability of NMR for the characterization, at a molecular level, of the dynamics and structural organization of polymeric solids. A chapter on applications emphasizes polymer types and properties, and the authors include an introduction to all the main principles of NMR involved in its application to solid polymers.
