

This is a legendary work by the famed Swiss expert on guerrilla warfare, Major H. von Dach. Survivalists have rediscovered this important study on resistance and underground operations, some making it the keystone of their libraries. Well-written and illustrated with easy-to-understand drawings, Total Resistance analyzes and overviews the techniques needed to overcome an invading force, formation of guerrilla units, weapons, food and medical considerations, ambushes, sabotage and much more.

Calculate the total resistance of resistors in parallel with ease! Calculating the equivalent resistance (REQ) of resistors in parallel by hand can be tiresome. In the previous series resistor network we saw that the total resistance, R_T of the circuit was equal to the sum of all the individual resistors added together. Resistor circuits that combine series and parallel resistors networks together are R_A is in series with R_7 therefore the total resistance will be $R_A + R_7 = 4 + 8$. To calculate the total overall resistance of a number of resistors connected in this way you add up the individual resistances. This is done using the following.

Calculating Total Resistance: Example Question #1. Ten resistors, each with resistance, are set up in series. What is their equivalent resistance? Possible. Total resistance in a circuit depends on whether the resistors are in series or parallel since this determines which equation is to be used. In ser.
